

III. Projectiles at an Angle

1. A machine launches a tennis ball at an angle of 45.0 degrees above the horizontal. The ball has an initial vertical velocity of 9.00 m/s and an initial horizontal velocity of 9.00 m/s. The ball reaches its maximum height 0.920 s after its launch. (Neglect air resistance and assume the ball lands at the same height from which it was launched.)

- A. Determine the speed of the ball as it leaves the launcher.

$$v_{ix} = v_i \cos \theta$$

$$v_i = \frac{v_{ix}}{\cos \theta} = \frac{9 \text{ m/s}}{\cos 45^\circ} = \boxed{12.7 \text{ m/s}}$$

- B. Determine the horizontal distance traveled by the ball during the ENTIRE time it is in the air.

$$d_x = v_{ix} t_{\text{TOTAL}} = (9 \text{ m/s})(1.84 \text{ s}) = \boxed{16.6 \text{ m}}$$

$$t_{\text{TOTAL}} = 2t_{\text{up}} = 2(0.92 \text{ s}) = 1.84 \text{ s}$$

X	Y
$v_{ix} = 9 \text{ m/s}$	$v_{iy} = 9 \text{ m/s}$
$a_x = 0$	$a_y = -9.81 \frac{\text{m}}{\text{s}^2}$

$t_{\text{up}} = 0.92 \text{ s}$

- C. Determine the maximum height of the projectile.

$$d_y = ?$$

$$v_{fy} = 0$$

$$v_{fy}^2 = v_{iy}^2 + 2a_y d_y$$

$$d_y = \frac{v_{fy}^2 - v_{iy}^2}{2a_y} = \frac{-(9 \text{ m/s})^2}{2(-9.81 \text{ m/s}^2)} = \boxed{4.13 \text{ m}}$$

- D. Compared to the vertical acceleration of the ball at the time of launch, the vertical acceleration of the ball at elapsed time 0.920 s is (A) less, (B) greater, (C) same

ALWAYS
-9.81 m/s²
